PROFESSIONAL SUMMARY

Red team and offensive security practitioner with hands-on experience in malware development, adversary simulation, and endpoint security evasion research. Strong focus on Windows internals, payload execution, and evaluating modern defensive controls through realistic attack tradecraft.

CORE SKILLS

Offensive Security: Red Team Operations, Adversary Simulation, Threat Emulation, Penetration Testing

Malware Development: Payload Development, In-Memory Execution, Process Injection Concepts, Evasion Techniques

Endpoint Security Research: Antivirus & EDR Evasion Concepts, Security Control Bypass Testing, Detection Gaps Analysis

Windows Internals: Process Architecture, API Usage, Privilege Contexts, Memory Management Fundamentals

Web & Network Security: Web Application Testing, Internal Network Attacks, Reconnaissance

Scripting & Automation: Python, PowerShell, Bash

Tools & Platforms: Kali Linux, Metasploit, Burp Suite, Nmap, Wireshark, Ghidra, Git

EXPERIENCE

Vulnerability Assessment & Penetration Testing Intern

Jul 2025 – Aug 2025

National Cyber Emergency Response Team (PKCERT)

- Conducted authorized penetration testing against Windows environments and internal web applications.
- Developed and tested custom payloads to evaluate antivirus and endpoint detection effectiveness.
- Simulated attacker execution and lateral movement techniques to assess organizational exposure.
- Produced technical reports translating offensive findings into remediation actions.

Capture The Flag (CTF) Player

2023 — Present

National and International Cybersecurity Competitor

- Competed in CTFs including Ignite National Cybersecurity Hackathon, Pakistan Cybersecurity Challenge (PCC) by NCCS, Hack The Box, and BlackHat MEA Online Qualifier (185th out of 1500 teams).
- Focused on offensive security domains such as penetration testing, reverse engineering, binary exploitation, and web security.

CERTIFICATIONS

eLearnSecurity Junior Penetration Tester (eJPTv2)

SELECTED PROJECTS

Stealth Adversary Simulation Platform (Final Year Project)

Offensive Security Research Project

- Designed a red team simulation framework focused on covert payload execution and endpoint evasion.
- Implemented execution techniques emphasizing low-noise, in-memory operations.
- Used project results to evaluate detection blind spots in modern endpoint defenses.

IoT Firmware Security Assessment

- Performed static and dynamic analysis of embedded Linux firmware images.
- Identified insecure services, hardcoded credentials, and misconfigurations.

TECHNICAL LITERATURE & INDEPENDENT RESEARCH

Antivirus Bypass Techniques — Studied as part of independent malware research and endpoint evasion experimentation

EDUCATION

Ghulam Ishaq Khan Institute of Engineering Sciences and Technology

Swabi, Pakistan

B.Sc. in Cyber Security (GPA: 3.39/4.00)

Sep 2022 – Expected 2026
